▸ Implications

▸ Epilogue: against temporal exceptionalism

MEET THE TENSE–MOOD CONFOUND

▸ much of the debate on tenselessness hinges on the status of various constraints on **future time reference** (FTR)

   ▸ Matthewson (2006) on St'át'imcets

      ▸ matrix clauses that contain no overt tense marker are incompatible with FTR

(1.1)   Táyt-kan   lhkúnsa / # natcw   / # zánucwem
         hungry-1SG.SUB now   one.day.away   next.year
         'I am hungry now'; not 'I will be hungry tomorrow/next year'

(1.2)   K'ác-an'-lhkan   i-nátcw-as
         dry-DIR-1SG.SUB   when.PAST-one.day.away-3CONJ

         / # natcw   / # zánucwem
         one.day.away   next.year

         'I dried it yesterday'; not 'I will dry it tomorrow/next year'
         (Matthewson 2006: 677)

▸ Matthewson (2006) on St'át'imcets (cont.)

　　▸ however, as in Yucatec (and to some extent in English), conditional antecedents can have FTR w/o marking

(1.3)　Lh-7áts'x-en-acw　　　　　s-Laura
　　　　HYP-see-DIR-2SG.CONJ　NOM-Laura

　　　　tsun　　　xwem-ás　　kw　s-nas-ts　　　　　úxwal'
　　　　say(DIR) fast-3CONJ　DET NOM-go-3POSS　go.home

　　　　'If you see Laura, tell her to hurry up and go home'
　　　　(Matthewson 2006: 678)

▸ Matthewson (2006) on St'át'imcets (cont.)

   ▸ there is a variety of options for expressing FTR

      ▸ including the prospective aspect marker *cuz'*
       and the future marker *kelh*

         ▸ which Matthewson treats as a temporal ordering modal
          expressing Abusch's (1988) *woll*

(1.4)   **Cuz'**   qwatsáts   ta   naplít-a
        PROSP leave   DET   priest-DET
        'The priest is going to leave' (Matthewson 2006: 678)

      ▸ the most common marker w/ FTR is *kelh*

(1.5)   Táyt-kan   **kelh**
        hungry-1SG.SUB   FUT
        'I will be hungry' (not: 'I am/was hungry') (Matthewson 2006: 677)

▸ Matthewson (2006) on St'át'imcets (cont.)

  ▸ Matthewson's (2006) analysis

    ▸ St'át'imcets has an unpronounced non-future tense marker

      ▸ in matrix clauses, *kelh* and *cuz'* pick up non-future reference times from this non-future marker

        ▸ returning either absolute future or future-in-the-past interpretations

      ▸ adopted e.g. by Hayashi (2011) for Inuktitut; Jóhannsdóttir & Matthewson (2008) for Gitxsan (Tsimshianic)

▸ Matthewson (2006) on St'át'imcets (cont.)

　　▸ in the following, I use the terms

　　　　▸ **covert past/non-future** for zero-morphemes assumed to express past/non-future tense

　　　　▸ **cryptopast** for aspectual/modal morphemes assumed to conflate past/non-future tense

▸ a profoundly tenseless alternative to covert/cryptopasts: mood-based analyses

  ▸ Bittner (2005; 2013; ms) on Kalaallisut (West Greenlandic)

    ▸ Kalaallisut is a mood-centered language

(1.7) a. *Ole {ullumi/#aqagu)   aallar-**pu**-q.*
         Ole today/tomorrow leave-**DEC**$_{iv}$ -3S$_{(T)}$
         'Ole left {today/#tomorrow}.'

    b. *Ole {ullumi/#aqagu) aallar-**p(i)**-a?*
       Ole today/tomorrow leave-**QUE** -3S$_{(T)}$
       'Did Ole leave {today/#tomorrow}?'

c. *Aallar-**li**-Ø!*
   leave-**OPT** -3S$_!$
   'Let him leave!'

d. *Aallar-**(g)i**-t!*
   leave-**IMP** -2S$_!$
   'Leave!'

"Fact-oriented moods assert that (DEC , FCT), or inquire whether (QUE), the eventuality of the verb is a **currently verifiable fact** –i.e. an event that has already happened (see [(4.2a-b)]), or a state that has at least begun […], in the same world as the speech act." (Bittner 2013: 36; emphasis *JB*)

▸ mood-based analyses (cont.)

  ▸ as a consequence, reference to the future
    is apparently exclusively indirect in Kalaallisut

    ▸ via non-future topic times

"PROSPECTIVITY THESIS
Kalaallisut translations of future auxiliaries comprise three related classes:
       A. prospective statives evoking (current) attitude states to de se prospects,
       B. prospective inchoatives evoking (realized) starts of expected processes,
       C. prospective matrix moods marking the speech act as a request or wish."
(Bittner 2005: 354)

  ▸ Tonhauser adopts Bittner's Prospectivity Thesis
    for Paraguayan Guaraní

    ▸ but does not address the role of mood

▸ a third option?

  ▸ Mucha (2013) argues that FTR constraints in Hausa
    are pragmatic in nature

    ▸ and do not arise in appropriate discourse contexts

      ▸ I argue below that FTR constraints in Yucatec
        also involve a pragmatic component

        ▸ but they are not sensitive to the discourse context

          ▸ but exclusively to the syntactic context

▸ the central question of this talk

  ▸ how do we distinguish factual/realis moods
     such as invoked by Bittner's proposal

     ▸ from non-future tenses
        such as invoked by Matthewson's?

  ▸ after all, the sets of data accounted for by the two
     are largely coextensive

     ▸ assuming currently verifiable facts
        cannot populate the future

▸ today's test case: Yucatec Maya

▸ preview

▸ revisit the facts of FTR constraints in this language first drawn attention to in Bohnemeyer (1998)

▸ bring new data to bear concerning the behavior of perfective aspect markers in counterfactuals

▸ develop a revised mood-based account as a result

OUTLINE

▸ Meet the tense-mood confound

▸ Counterfactuals to the rescue?

▸ The Yucatec data I: background

▸ The Yucatec data II: counterfactuals

▸ Back to the future

▸ Implications

▸ Epilogue: against temporal exceptionalism

COUNTERFACTUALS TO THE RESCUE?

▸ one domain for which mood- and tense-based accounts of FTR constraints make distinct predictions: counterfactuals

  ▸ nonfuture tenses should be possible
  with counter-factual reference

    ▸ and may actually be required for it

  ▸ in contrast, realis moods
  should straightforwardly be excluded in counterfactuals

a typology of conditionals

Table 1.1. *Classification of conditionals based on von Fintel (2009) and Iatridou (2000)*

Type of conditional	Example	Implicature
Speech act	*If you're hungry, there's bread and cheese in the fridge*	N/A
Premise/factual	*If you're so clever, why don't you do this problem on your own?*	N/A
Indicative Epistemic (past/present-oriented)	*If Sally decided to become a drummer, she's happy* *If Sally is happy, she decided to become a drummer*	Uncertainty regarding whether Sally decided to become a drummer/is happy
Hypothetical (future-oriented)	*If Sally decides to become a drummer, she'll be happy*	Uncertainty regarding Sally's decision
Counterfactual PastCF	*If Sally had decided to become a drummer, she would be happy*	Sally decided not to become a drummer (and is not happy)
PresentCF	*If Sally were happy, she would go out more*	Sally is not happy (and doesn't go out much)
Future less vivid (FLV)	*If Sally would decide to become a drummer, she would quit semantics*	It's unlikely that Sally will decide to become a drummer

▸ Iatridou's (2000) account of the semantic and morphological makeup of Indo-European counterfactuals (CFs)

  ▸ English and Modern Greek (MG) CFs involve two kinds of temporal/modal morphology: past and future

(2.1) An **iχe**   pari   to   siropi **θa**   **iχe**   ɣini   kala
MG   if   **PLUPERF**   taken   the   syrup   **FUT**   **PLUPERF** become better
     'If he **had** taken the syrup, he **would have** gotten better'
     (Iatridou 2000: 233)

  ▸ Iatridou assumes
    that *would* conflates Abusch's (1988) *woll* future w/ past

▸ Iatridou's account (cont.)

  ▸ this holds for FLV conditionals
    as well as for PastCFs and PresCFs

(2.1) An **eperne**   afto to   siropi **θa** ɣˌ**inotan**   kala
MG   if   take.**PST**.IMPV this the syrup **FUT** become.**PST**.IMPV better
       'If he **took** this syrup, he **would** get better'
       (Iatridou 2000: 234)

▸ Iatridou's account (cont.)

  ▸ Iatridou does not discuss the role of the future morphology

    ▸ which is optional in some of the languages in her sample

  ▸ my assumption: future marking in CF conditionals is linked to a speech act of or akin to *prediction*

    ▸ whether that's expressed by the future morphology or not

▸ Iatridou's account (cont.)

  ▸ evidence that counterfactuality (the ¬p inference) is an implicature

(2.3) If the patient had the measles, he would have exactly the symptoms he has now. We conclude, therefore, that the patient has the measles.

(2.4) If the butler had done it, we would have found blood on the kitchen knife. The knife was clean; therefore, the butler did not do it. (conclusion is not redundant)
(Iatridou 2000: 232)

▸ Iatridou's account (cont.)

  ▸ Iatridou argues that the past morphology in CF conditionals has two functions

    ▸ in PastCFs, it indicates
    that the **topic time** t_{TOP} precedes the utterance time

    ▸ in addition, in all types of CFs,
    it expresses the **exclusion feature** (**ExclF**)

      ▸ it indicates that the set of **topic worlds** under consideration excludes the **utterance world** w_u

        ▸ thereby triggering an implicature to the effect
        that w_u does not contain the described situation within t_{TOP}

▸ implications and questions

  ▸ if FTR constraints in Language *L* are the result of covert/cryptopast marker *PST*, *PST* should also occur in *L*'s CFs

  ▸ if profoundly tenseless languages exist,
 how do they express ExclF?

OUTLINE

▸ Meet the tense-mood confound

▸ Counterfactuals to the rescue?

▸ The Yucatec data I: background

▸ The Yucatec data II: counterfactuals

▸ Back to the future

▸ Implications

▸ Epilogue: against temporal exceptionalism

THE YUCATEC DATA I: BACKGROUND

▸ FTR constraints: the (complex) basic facts

Table 3.1. *Finite clauses and future topic times in Yucatec*

Syntactic environment / Clause type	Matrix clauses	Conditional antecedetents Indicative	Counterfactual	Other finite subordinate clauses
Perfectives	Not with FTR	Unconstrained	Excluded	Not with FTR
All other	Unconstrained			

TODAY'S TALK

▸ testing for deictic tense: is a clause formed with a given marker compatible with present, past, and future topic times?

　▸ e.g., the perfect-like 'terminative' aspect marker *ts'o'k*

　　▸ with a past topic time, like a pluperfect:

(3.1)　*K-u=k'uch-ul-o'b=e'*,
　　　　IMPF-A.3=arrive-INC=TOP

　　　ts'o'k　*u=kim-il*　　　　*le=chàampal=e'*.
　　　TERM　A.3=die-INC　　DEF=small:child=D3

　　　'(By the time) they arrived, the baby **had** already died.'

▸   with a future topic time, like a future perfect:

(3.2)   *Sáamal*   *óok-a'n+k'ìin=e'*
        tomorrow   enter-RES+sun=TOP

        ts'o'k   *u=bèet-ik*   *le=túus+bèel=o'*
        TERM   A.3=do-INC(B.3.S)   DEF=send+way:REL=D2

        'By tomorrow at dusk (the boy) **will have done** the errand.'
        (Andrade 1955: 135-136)

▸ all Yucatec clauses are freely compatible with topic times in
   the past, present, and future of utterance time

   ▸ with one exception: the perfective aspect marker *t-/h-*

▸ perfective aspect excludes FTR in matrix clauses

(3.5) #**T-**in=ts'on-ah   le=kèeh   sáamal=o',
       PRV-A1SG=shoot-CMP(B3SG) DEF=deer   tomorrow=D2
          intended: 'I will shoot the deer tomorrow'

   ▸ it does, however, occur w/ FTR
      in hypothetical conditional antecedents

(3.6) Wáah **t-**in=ts'on-ah   le=kèeh   sáamal=o',
       ALT   **PRV-**A1SG=shoot-CMP(B3SG) DEF=deer   tomorrow=D2

         he'   in=tàas-ik=e'!
         ASS   A1SG=come:CAUS-INC(B3SG)=D3

         'If I shoot the deer tomorrow, I agree to bring it!'

▸ the use of the perfective in conditional antecedents does not convey counterfactuality

  ▸ for this meaning, subjunctive mood is used

(3.7) [I'm not allowed to vote in the upcoming local
        election, since I'm not a Mexican Citizen.]

Pero wáah káa   bèey-**lak**   in=bóotare',
but   ALT   SR   like.this-INCH.**SUBJ**(B3SG)   A1SG=vote

hi'n=bóotar-t-ik   Pablo=e'.
ASS:A1SG=vote-APP-INC(B3SG)   Pablo=D3

'But if I were able to vote, I'd definitely vote (for) Pablo.'

▸ future topic times freely occur outside perfective clauses

  ▸ so Bittner's Prospectivity Thesis is untenable for Yucatec

(3.8)   *Sáamal*   *óok-a'n+k'ìin=e'*
        tomorrow   enter-RES+sun=TOP

      ts'o'k   *u=bèet-ik*   *le=túus+bèel=o'*
      TERM   A3=do-INC(B.3.S)   DEF=send+way:REL=D2

      'By tomorrow at dusk (the boy) **will have done** the errand.'
       (Andrade 1955: 135-136)

▸ unlike in Hausa (Mucha 2013),
   FTR constraints are not lifted by suitable discourse contexts

(3.9) [QUESTION: What your brother DO if you don't go to
        see him today, do you think? ANSWER:]

   a. **Yan** u=túuxt-ik   tèen hun-p'éel kàarta
       OBL A3=send-INC(B3SG) me   one-CL.IN letter
       'He'll send me a letter'

   b. #**T-**u=túuxt-ah   tèen hun-p'éel kàarta
       PRV-A3=send-CMB(B3SG) me   one-CL.IN letter
       intended: 'He'll send me a letter'

▸ Bohnemeyer's (1998, 2002, 2009) mood-based account of Yucatec FTR constraints

Modal Commitment Constraint: The realization of events in the (deictic or anaphoric) future cannot be asserted, denied, questioned, or presupposed as fact. Assertions and questions regarding the future realization of events require specification of a modal attitude on the part of the speaker.

Event Realization: A predicate P is realized by event e at topic time t_{TOP}, or equivalently, e is realized under P at t_{TOP}, if and only if at least the run time of a subevent e' of e that also falls in the denotation of P is included in t_{TOP}:

$$\forall P, t_{TOP}, e \in E \; [REAL_E(P, t_{TOP}, e) \leftrightarrow \exists e' [P(e') \; \& \; e' \ll_E e \; \& \; \tau(e') \leq_T t_{TOP}]]$$

(Bohnemeyer & Swift 2004: 286)

▸ Bohnemeyer's (1998, 2002, 2009) MCC (cont.)

  ▸ Problem I: statives and imperfectives of atelic predicates generally entail realization at t_{TOP}

    ▸ yet are not subject to FTR constraints

  ▸ Problem II: perfect-like markers such as *ts'o'k* presuppose realization, but are not subject to FTR constraints either

OUTLINE

▸ Meet the tense-mood confound

▸ The Yucatec data I: background

▸ The Yucatec data II: counterfactuals

▸ Back to the future

▸ Implications

▸ Epilogue: against temporal exceptionalism

THE YUCATEC DATA II: COUNTERFACTUALS

▸ the study

  ▸ stimuli: 22 scenarios

    ▸ 10 PastCF; 4 PresCF; 3 FLV; 3 hypothetical; 2 epistemic

    ▸ varied in terms of

      ▸ the presence of overt negation
        in the antecedent, consequent, both, or neither

      ▸ the lexical-aspectual type of the predications

      ▸ the temporal relation between the described situations

  ▸ participants: 4 Yucatec speakers 40-71 years old (all male)

▸ the study (cont.)

    ▸ method: for each scenario

        ▸ construct a Yucatec rendition with one speaker

        ▸ have all four renarrate in their own words (in separate sessions), encouraging them to improve the wording

        ▸ if perfective aspect is disused in the antecedent, consequent, or both, try and substitute it

            ▸ and elicit the speakers' judgments and interpretations of the resulting sentences

‣ the study (cont.)

  ‣ example

(3.1) Pedro=e' Estados Unidos kah-akbal.
       Pedro=TOP United States   live-DIS(B3SG)

 intended: 'the corn would have turned out really well.'

▸ ## results I: the perfective

Table 4.1. *Distribution of perfective aspect markers across conditional types*

Type of conditional	Perfective in the antecedent?	Perfective in the consequent?
Indicative 　　　　Epistemic (past/present-oriented)	Yes	??? (Not tested)
Hypothetical (future-oriented)	Yes	No (modals used instead)
Counterfactual 　　　　　PastCF	No (subjunctive used instead)	No ('terminative' aspect used instead)
PresentCF	N/A (semantically inappropriate)	No ('terminative' aspect used instead)
Future less vivid (FLV)	No (subjunctive used instead)	No (modals used instead)

‣ results I: the perfective (cont.)

   ‣ intriguingly, in PastCF scenarios

      ‣ attempted substitutions of perfectives in the antecedent yielded
         reinterpretations of the scenario as hypothetical

(3.2) [Context: as in (3.1)] Attempted substitution:

Wáah ma'   **h-**òok'   lete=chak+íik'-al=o'...

ALT   NEG(B3SG) **PRV-**enter(B3SG)   it:DEF=rain+wind-INC=D2

intended: 'If the storm hadn't entered...'

Elicited continuation:

...yan u=yàan-tal   le=nal=o'.

OBL   A3=EXIST-INCH.INC DEF=maize=D2

'...the corn will turn out (well).'
 Speaker comment: *Futuro* ('future')!

‣ results I: the perfective (cont.)

    ‣ note the contrast b/w FLV and hypothetical scenarios

(3.3) [Context: similar to (3.1), but Pedro calls before the harvest]

   a. FLV

    Wáah káa tàal-**ak**   hun-p'éel chak+íik'-al=o'

    ALT   SR   come-**SUBJ**(B3SG) one-CL.IN   rain+wind-INC=D2

    'If a storm had come / were to come'

    yan u=k'àas-kun-t-ik   le=kosèecha=o'.

    OBL A3=bad-CAUS-APP-INC(B3SG) DEF=harvest=D2

    'it would destroy the harvest.'

    Speaker comment: no evidence of a storm in the area at utterance time.

▸ FLV-hypothetical contrast (cont.)

(3.3) [Context: similar to (3.1), but Pedro calls before the harvest]

b. Hypothetical

Wáah **h-**tàal   hun-p'éel chak+íik'-al=o'

ALT   **PRV-**come(B3SG)   one-CL.IN   rain+wind-INC=D2

'If a storm comes'

yan u=k'àas-kun-t-ik   le=kosèecha=o'.

OBL A3=bad-CAUS-APP-INC(B3SG) DEF=harvest=D2

'it will destroy the harvest.'

Speaker comment: a storm is already approaching; *chakíik'al* 'storm' should actually be definite here!

▸ however, for some speakers, the subjunctive antecedent can be used with the hypothetical interpretation as well

‣ results II: the exclusion feature (ExclF)

　　‣ ExclF is expressed by means of the deictic temporal adverbs
　　　ka'ch 'formerly' and *béeh* 'now'

　　　　‣ one or both may be used
　　　　　in the antecedent and/or the consequent

　　　　‣ their use is optional

　　　　‣ however, if neither is used in either clause,
　　　　　it becomes harder to recover the CF sense

　　　　　　‣ although this is in principle still possible in context

‣ results II: the exclusion feature (ExclF) (cont.)

  ‣ that *ka'ch* 'formerly' expresses ExclF rather than anteriority (Iatridou: 'fake past') is evident from its use in PresCFs

(3.4) [Context: Pedro and Juan are taking a walk in the cemetery. Night has fallen. Suddenly they hear a terrible scream. Says Juan: "Thank God I don't believe in ghosts!…]

Wáah tíin   krèer-t-ik   ha's-ah+òol   **ka'ch**-il=e',
ALT   PROG:1SG believe-APP-INC(B3SG) shake:CAUS-ATP+life.force **formerly**-REL=TOP

béeh sahak-en   be'òora=a'!"
now   afraid-B1SG now=D1

'If I believed in ghosts, I'd be scared now!"'

▸ Implications

▸ Epilogue: against temporal exceptionalism

BACK TO THE FUTURE

▸ how to make sense of the distribution of perfectives in conditionals?

  ▸ hypothesis: the perfective aspect marker, unlike other aspects, conflates *realis mood*

    ▸ which I take to be a speech act meaning representing the inclusion of the topic worlds in the utterance world

(4.1) $\llbracket PRV \rrbracket^c = \lambda w.\lambda s.\lambda P.P(s) \wedge \tau(s) \subseteq t_{TOP}(c)$ - aspectual meaning

$\qquad\qquad w \in W_{TOP}(c) \longrightarrow w \ll w_U(c)$ - speech act meaning

$\qquad\qquad W_{TOP}(c)$ - the set of topic worlds at context c

$\qquad\qquad \ll$ - non-proper part-of relation

▸ the mood/illocutionary restriction explains straightforwardly

  ▸ why the perfective markers are incompatible with FTR
     in matrix clauses

    ▸ while avoiding the overgeneralization of the Modal
       Commitment Constraint of Bohnemeyer (1998)

      ▸ which makes incorrect predictions
         for a number of clause types

▸ in the same way, it correctly predicts that perfectives are
   unavailable in counterfactual consequents

▸ conditional antecedents block illocutionary meanings

   ▸ as subordinate clauses commonly do

      ▸ e.g., (4.2) does not make a promise

(4.2) *If I promise you to consider your evidence,
you'll promise me to consider mine.*

      ▸ this accounts for why perfectives are fine
in epistemic and hypothetical antecedents

▸ but why then are perfectives excluded in CF antecedents?

    ▸ because the realis constraint on the topic worlds, while no longer effective at the speech act level

        ▸ is still semantically incompatible with ExclF and thus blocks the counterfactual implicature

        ▸ *inside the antecedent*

▸ **and why should only the perfective aspect markers conflate realis mood?**

   ▸ **the first argument comes from the unique association of perfective aspect with completive 'status'**

      ▸ **status being a morphological mood category in Mayan**

Table 5.1. *Distribution of status categories across predication types*

Status category	Distribution Matrix clauses	Finite subordinate clauses	Nonfinite verbal projections
Completive	Perfective aspect		N/A
Incompletive	Imperfective aspect	Imperfective aspect; purpose clauses	Gerunds; complements of predicates expressing aspectual, causal, modal, and event perception meanings; intensional complements of intransitive predicates of fear, desire, attempt; intransitive complements in the motion-cum-purpose construction
Subjunctive	'Insubordinate' (Evans 2007) jussives	Irrealis clauses; counterfactual conditional antecedents	Intensional complements of transitive predicates of fear, desire, attempt; transitive complements in the motion-cum-purpose construction; complements with projective and counterfactual contents
Imperative	Imperative sentences	N/A	N/A
Extra-focal	N/A	Background clause in manner focus constructions w/ perfective aspect	N/A

‣ perfectives are the only aspectual/modal markers that occur with completive status suffixes

  ‣ and the completive is the sole status category that is restricted to finite clauses

    ‣ thus it seems plausible

      ‣ that the perfectives would inherit realis mood from the completive status suffix

▸ in addition, perfective aspect has a unique role in discourse

  ▸ in that it is the sole aspect for introducing new temporal reference points (Bohnemeyer 2009)

    ▸ thus, perfective clauses serve as "pillars" supporting the discourse representation and common ground

      ▸ so pairing them with realis mood might facilitate the cognitive "bookkeeping" of discourse

OUTLINE

▸ Meet the tense-mood confound

▸ Counterfactuals to the rescue?

▸ The Yucatec data I: background

▸ The Yucatec data II: counterfactuals

▸ Back to the future

▸ Implications

▸ Epilogue: against temporal exceptionalism

IMPLICATIONS

‣ Yucatec disallows perfectives in counterfactuals

   ‣ just as it disallows them in matrix clauses with FTR

   ‣ suggesting strongly that Yucatec perfectives are no cryptopasts

      ‣ and thus that Yucatec is profoundly tenseless

▸ a tenseless recipe for cooking up counterfactuals

  ▸ use temporal adverbs to express the exclusion feature triggering the counterfactual implicature

    ▸ that this is possible lends impressive support to Iatridou's (2000) theory of counterfactuals

▸ counterfactuals appear to be a diagnostic context
   for differentiating past tenses from realis moods

   ▸ thus, hypothesized covert pasts and cryptopasts
      can and should be tested in this environment

OUTLINE

▸ Meet the tense-mood confound

▸ Counterfactuals to the rescue?

▸ The Yucatec data I: background

▸ The Yucatec data II: counterfactuals

▸ Back to the future

▸ Implications

▸ Epilogue: against temporal exceptionalism

EPILOGUE: AGAINST TEMPORAL EXCEPTIONALISM

▸ why are we (still) debating
whether profound tenselessness is a thing?

   ▸ why are we not having the same debate
   over definite articles or evidentials, etc

      ▸ nor over functional categories
      that might be expressed and composed "above" tense

         ▸ such as illocution and information perspective?

▸ perhaps the debate could benefit

   ▸ if those supporting **temporal exceptionalism**
   gave explicit reasons for why they think tense is different?
